a Better California

Applied Technology Services

Committed to delivering practical solutions to challenging problems

CALCULATION WORKFLOW

- LiDAR data processing
 - Extract pole, span, and fall-in tree geospatial information from LiDAR database
- Import processed data into Excel spreadsheet
 - Determine Tree–Span–Pole associations based on the LiDAR geospatial info
 - **Tree strike threat:** Calculate number of fall-in trees in each span that can touch the line
 - **Trees within 6 ft:** Calculate number of fall-in trees in each span that are within 6 ft from the line
 - Rank and color code the spans in each category based on the number of trees in each span
- Output results to Google Earth for visualization
 - For each circuit, span, pole, and tree results are output to separate KMZ files such that they are shown as different layers in Google Earth

Assumptions for Non-Hardened System

- Tree-Span relationship is tagged in LiDAR (see figure)
- All fall-in trees have potential to strike the span regardless of wind speed and wind direction
- Tree strike failure is counted as true when a tree is tagged as fall-in with non-zero Overstrike
- Spans are ranked based on the number of fall-in trees in each span

Definition of KMZ Layer Symbols and Line Colors

- Tree strike threat color coding
 - Thick red lines: Spans that have more than 15 fall-in trees that can touch the line
 - Thick orange lines: Spans that have 6 to 15 fall-in trees that can touch the line
 - Thick yellow lines: Spans that have 1 to 5 fall-in trees that can touch the line
 - Thick green lines: Spans that have zero fall-in tree that can touch the line
- Tree distance color coding
 - Thin red lines: Spans that have more than 15 fall-in trees within 6 ft of the line
 - Thin orange lines: Spans that have 6 to 15 fall-in trees within 6 ft of the line
 - Thin yellow lines: Spans that have 1 to 5 fall-in trees within 6 ft of the line
 - Thin green lines: Spans that have zero 15 fall-in tree within 6 ft of the line

RESULTS 1/2

- Tree strike threat calculation
 - Tree counts that can touch the non-hardened line
- Residual risk calculation

$$= \frac{\text{No. of Spans in Threat Level}}{\text{Total Spans}} \times \text{Weight Factor}$$

Upper Lake 1101

Threat Level	Trees Touching Non-Hardened (No. of spans)	Linear Span Length (miles)	Tree Strike Residual Risk	
			Weight Factor	Non-Hardened
High (15+ trees)	75	4.76	1	0.087
Medium (5-15 trees)	228	13.30	0.75	0.199
Low (1-5 trees)	333	18.44	0.50	0.194
None	223	11.10	0	0.000
Total:	859	47.61		0.480
