Can you ask them the following of the team in Afghanistan:

What is your network configuration for devices connected via Ethernet? How do you block the unauthorized devices from being able to go online? Does your DHCP server only assign addresses to the clients whose MAC address is in your server? Do you use proxy servers for internet connectivity? Can you confirm that your routers will allow us outbound connectivity to port 443(?) to our servers here in US?

Please confirm with Antti what's the port address of our server on which we are running our elab servers so the device can reach it successfully.

Thanks.
