

# Thyroid Stimulating Hormone (TSH) Assay Development Report

**Theranos, Inc.**

April 4, 2011

Prepared by: Tina Noyes

This Development Report contains Theranos Confidential Information and is being provided under the parties' Mutual Confidentiality Agreement. Any further dissemination, use or disclosure of the Report, in whole or in part, is strictly prohibited.

## TABLE OF CONTENTS

[ TOC \o "1-3" \h \z \u ]**LIST OF TABLES**

[ TOC \h \z \c "Table" ]

## LIST OF FIGURES

[ TOC \h \z \c "Figure" ]

## 1. ASSAY INFORMATION [ TC "ASSAY INFORMATION" \f C \l "2" ]

### 1.1 Assay Specifications [ TC "Assay Specifications" \f C \l "3" ]

This assay is designed to detect human Thyroid Stimulating Hormone (TSH) in human whole blood, plasma and serum. The assay has a reportable range of 0.05 to 50 uIU/mL, and is calibrated to the WHO Third International Standard (NIBSC 81/565).

#### 1.1.1 Reference Assays [ TC "Reference Assays and Standards" \f C \l "3" ]

The following commercial ELISA kits have been used in house as predicate methods:

- Alpco TSH ELISA (Cat# 25-TSHHU-E01)
- Alpco Ultrasensitive TSH ELISA (Cat # 25-TSHHUUE01)
- Genway TSH ELISA (Cat #40-521-475018)

#### 1.1.2 Materials and Methods [ TC "Materials and Methods" \f C \l "1" ]

A biotin-labeled anti-TSH antibody coated on an avidin surface serves as the capture surface for the sandwich ELISA. The sample (whole blood, plasma or serum) is diluted and then incubated on the capture surface for 10 minutes, then an alkaline phosphatase-labeled anti-TSH antibody is incubated on the surface for 10 minutes. After the detection antibody incubation, the surface is washed and the alkaline phosphatase substrate is incubated on the surface for 10 minutes, and then the resulting chemiluminescence is read in Relative Light Units (RLU).

**Table [ SEQ Table \\* ARABIC ]: Materials**

| <b>Name</b>  | <b>Supplier</b>                      | <b>Catalog #</b> |
|--|--------------------------------------|------------------|
| Human TSH  | Cell Sciences                        | CRT504-100       |
| Mouse Anti-Human TSH Antibody (CAb)                    | US Biological                        | T5400-13D        |
| Mouse Anti-Human TSH Antibody (DAb)                    | US Biological                        | T5400-22G        |
| Alkaline Phosphatase Labeling Kit (SH)                 | Dojindo                              | LK13             |
| Biotin Labeling Kit (SH)                               | Dojindo                              | LK10             |
| Phospho Glo Substrate                                  | KPL                                  | 55-60-04         |
| Blocking Buffer<br>(3% BSA in TBS, 0.05% Sodium Azide) | Sigma (BSA, Fraction V,<br>99% Pure) | A3059-500G       |
| Carbonate-bicarbonate buffer                           | Sigma                                | C3041            |

## 2. ASSAY DEVELOPMENT

[ TC "ASSAY OPTIMIZATION" \F C \L "2" ]

### 1.2 Antibody Screening (MTP)[ TC "Detection Antibody Conjugate Verification" \f C \l "1" ]

To determine the optimal pair for the TSH ELISA, all combinations of 22 TSH antibodies were tested on a microtitre plate. The screening was performed with serum calibrators diluted 1:5 into assay buffer, 10ug/mL CAbs and 100ng/mL detection antibody in blocking buffer and no post sample wash.

**Table [ SEQ Table \\* ARABIC ]:** Antibody Information

| Number | Vendor            | Cat #     | Clone #      | Type     |

### 1.3 Cross Reactivity and Interference (MTP)

TSH is a glycoprotein comprised of an alpha and a beta subunit. The alpha subunit is identical to that of Follicle Stimulating Hormone (FSH), Luteinizing Hormone (LH) and Human chorionic gonadotropin (hCG). The beta subunit confers specificity among these pituitary hormones.

Due to this identical alpha subunit, the potential for cross reactivity is extremely high. Diagnosis of hyperthyroidism involves low levels of TSH, while FSH, LH or hCG could be elevated, so it is essential that the chosen antibody pair is free of cross reactivity that could lead to a false-normal measurement when in fact TSH is depressed. Therefore, cross reactivity and interference testing was conducted as a part of the antibody screening process.

Most of the pairs tested showed cross reactivity with one or all of the other hormones tested when no TSH was present. Borderline cross reactivity was defined as greater than 115% of the control background RLU, while unacceptable cross reactivity was defined as greater than 125% of the control background RLU. The candidate pairs with borderline or no cross reactivity of the microtitre plate were chosen for a cross reactivity screen on the Therasos System.

The assay conditions were with DAb at 100 ng/mL in Blocking Buffer, CAb at 10 ug/mL and a 1:5 sample dilution. Calibrators were prepared for TSH in TSH-depleted serum at 2x concentration, and then combined with equal volumes of either serum (control) or 2x test substance-spiked depleted serum to create 1x serum calibrators. The final concentration of the test substances in the serum were as follows:

FSH at 562.5 ng/mL (900mIU/mL)

LH at 60 ng/mL

hCG at 10,000 ng/mL

**Table [ SEQ Table \\* ARABIC ]: Cross Reactivity and Interference (MTP)**

## 1.4 Theranos System Screen and Cross Reactivity

Cross reactivity was combined with the usual antibody screening on the Theranos System, in order to determine the ideal antibody pair for the final automated assay conditions. The Theranos System test was done with a regular serum standard curve to evaluate the antibody pair dose response, and with the following concentrations of test hormones in the TSH-depleted serum to test for cross reactivity in the absence of TSH under the Theranos System conditions. The assay conditions were DAb at 100 ng/mL in Blocking Buffer, CAb at 10 ug/mL and a 1:5 sample dilution.

Concentration of cross reactivity test substances:

FSH at 562.5 ng/mL (900mIU/mL)

LH at 60 ng/mL

hCG at 10,000 ng/mL

From the Theranos System screening, there were 2 pairs that showed a good dose response and negligible cross reactivity with the other hormones: DAb 15 with CAb 8 and DAb 15 with CAb 12. These 2 pairs were chosen as the final candidate pairs to continue on with further testing.

**Table [ SEQ Table \\* ARABIC ]:** Theranos System Screen and Cross Reactivity

## 1.5 Training Set

### 1.5.1 Training Set Screen for Best 2 Pairs

The final candidate pairs were used to test 11 clinical serum samples on the Theranos System with DAb at 100 ng/mL in Blocking Buffer, CAb at 10 ug/mL and a 1:5 sample dilution. These samples were provided by Bioreclamation with pre-measured concentrations of TSH and were tested in the Alpco TSH ELISA and Alpco Ultrasensitive TSH ELISA, and the clinical correlations were compared. Clinical correlation will be later verified on a larger sample set with the final pair and the final assay conditions on a full calibration curve.

Both pairs of candidate antibodies produced acceptable correlation with both the supplier-reported concentration and the Alpco ELISA measured concentration for this small sample set. However CAb 12 provided better sensitivity with the un-optimized assay conditions.

**Table [ SEQ Table \\* ARABIC ]:** Clinical Samples - Training Set Results

| Sample# | Abbott Architect<br>(Reported by Bioreclamation) | Alpco Regular Kit | Alpco Ultrasensitive Kit | Genway Kit   | Theranos System,<br>[TSH] uIU/mL |        |

### 1.5.2 Complete Clinical Set for Final Pair

Once the antibody pair was finalized as CAb 12 and DAb 15, the complete set was compared in the Theranos Assay and the predicate methods. The correlation with the reported values and predicate methods was excellent across the assay range.

**Table [ SEQ Table \\* ARABIC ]:** Clinical Samples – Predicate and Theranos Results, uIU/mL

| Sample | Abbott Architect (Bioreclamation Reported) | Alpco Regular Kit | Alpco U/S Kit | Genway | Theranos |
|--------|--|-------------------|---------------|--------|----------|
| 1      | 0.87                                       | 1.55              |               | 0.78   | 0.72     |

## 1.6 Matrix Screen and Spike Recovery

To finalize the selection of the best antibody pair, a matrix screen was performed with spiked whole blood, plasma from the same sample of whole blood, serum and assay buffer with with DAb at 100 ng/mL in Blocking Buffer, CAb at 10 ug/mL and a 1:5 sample dilution. Neither pair showed significant matrix effects, but DAb 15 with CAb 12 performed most uniformly in all the tested matrixes. For this experiment, concentrations were all calculated based on the assay buffer standard curve (all other experiments shown are performed with a serum calibration).

**Table [ SEQ Table \\* ARABIC ]:** Matrix Screen Results for Pair 1 (DAb 15 with CAb 8)

Spike recovery is calculated based on an assay buffer standard curve.

## 1.7 Finalization of Antibody Pair

Based on the results from the clinical sample training set, the matrix screen and the sensitivity of the calibrated assay, the final antibody pair was chosen as DAb 15 with CAb 12. Backup pairs are as follows:

**Table [ SEQ Table \\* ARABIC ]:** Finalized Ranking of Best Antibody Pairs

| Rank | DAb# | CAb# |
|------|------|------|
| 1    | 15   | 12   |
| 2    | 15   | 8    |
| 3    | 11   | 12   |
| 4    | 11   | 8    |
| 5    | 16   | 8    |
| 6    | 2    | 8    |

## 1.8 Epitope Mapping (MTP)

Epitope mapping was performed on a microtitre plate. The DAb was spiked with other anti-TSH unlabeled antibodies and testing for interference in the assay. The positive control was unlabeled Ab 15 spiked into the AP-labeled DAb15 to determine maximum competition for the DAb epitope. The testing was conducted with DAb at 100 ng/mL in Blocking Buffer, CAb at 10 ug/mL and a 1:5 sample dilution. Since there are limited unique exposed epitopes on the TSH beta subunit, it is not surprising that many of the tested antibodies bind to the same or nearby epitopes as evidenced by interference in the assay.

**Table [ SEQ Table \\* ARABIC ]:** Epitope Mapping (MTP)

| Antibody Number          | Type | [TSH] uIU/mL | Mean RLU | CV % | % of CTL |
|--------------------------|------|--------------|----------|------|----------|
| Control                  | -    | 25           | 58957    | 2.2  | -        |

## 1.9 Whole Blood Screen

To verify the normal range in whole blood, 11 samples were screened with DAb at 100 ng/mL in Blocking Buffer, CAb at 10 ug/mL and a 1:5 sample dilution. The samples were screened on 3 different days with different reagent lots, so the results are calibrated on the appropriate standard curve generated on the same day. These results corresponded with the expected normal range in serum for adults of 0.3 – 5 uIU/mL.

**Table [ SEQ Table \\* ARABIC ]:** Whole Blood Screen

| Sample | Date Tested | Sample ID     | Signal, RLU |      | Conc. uIU/mL |      |

### 1.11 Detection Antibody Conjugate Stabilizers

Two different commercial alkaline phosphatase stabilizing buffers were tested with assay conditions of 100 ng/mL DAb, 10 ug/mL CAb and a 1:5 sample dilution of serum calibrators. StabilZyme produced the best signal to background (S/B) and was chosen as the DAb diluent.

**Table [ SEQ Table \\* ARABIC ]:** Detection Antibody Conjugate Stabilizers

**Figure [ SEQ Figure \\* ARABIC ]:** Detection Antibody Conjugate Stabilizers

## 1.12 Capture Antibody Titration

The biotin conjugated capture antibody was titrated at 4 levels to determine the ideal coating concentration, with a DAb concentration of 100 ng/mL in StabilZyme and a 1:5 sample dilution of serum calibrators. A concentration of 5 ug/mL was optimal for modulation across the range and at the low end.

**Table [ SEQ Table \\* ARABIC ]:** Capture Antibody Titration

**Figure [ SEQ Figure \\* ARABIC ]:** Capture Antibody Titration

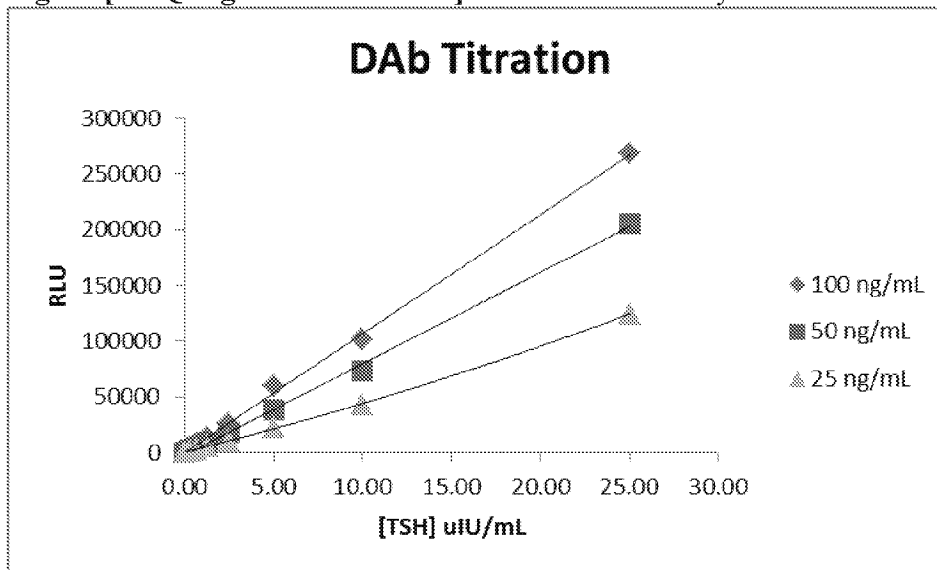

### 1.13 Detection Antibody Titration

The detection antibody was titrated in StabilZyme at 3 levels, with CAb at 5 ug/mL and a 1:5 sample dilution of serum calibrators, to determine the optimal working concentration. The original concentration of 100 ng/mL provided the best modulation across the range, and in particular at the low end of the assay where sensitivity is desired. Background did not decrease significantly as the detection antibody was titrated lower, therefore 100 ng/mL was chosen as the final concentration.

**Table [ SEQ Table \\* ARABIC ]:** Detection Antibody Titration

| [TSH] uIU/mL      | 100 ng/mL |      | 50 ng/mL |      | 25 ng/mL |      |
|-------------------|-----------|------|----------|------|----------|------|

**Figure [ SEQ Figure \\* ARABIC ]:** Detection Antibody Titration

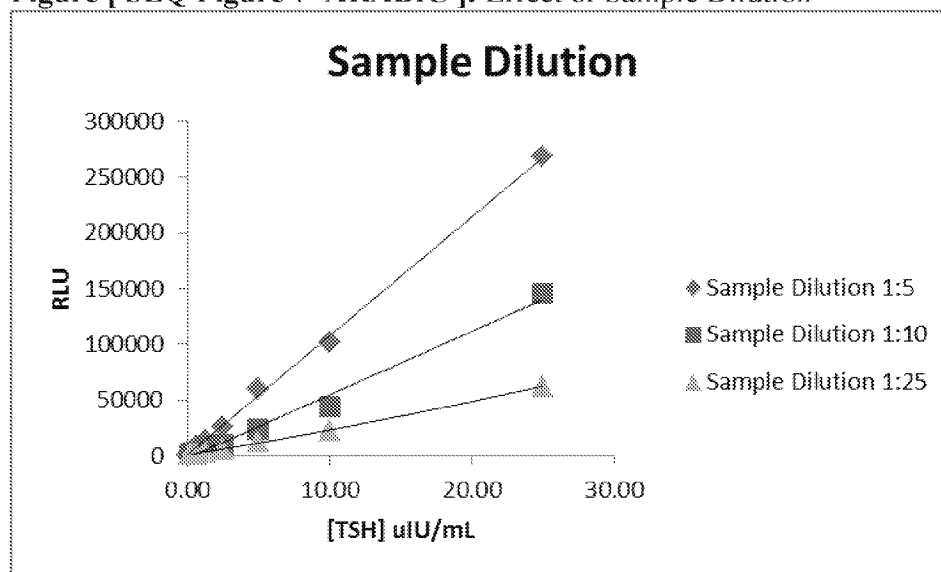

### 1.14 Effect of Sample Dilution

The effect of increasing sample dilutions was tested, with 1:5, 1:10 and 1:25 dilutions. Assay conditions were DAb 100 ng/mL in StabilZyme and 5 ug/mL CAb. The 1:5 sample dilution provides a very linear assay with good sensitivity. At 1:10 the signal to background is significantly lower and the sensitivity is decreased. At 1:25 the assay modulation is not sufficient to ensure the required sensitivity of 0.1 uIU/mL.

**Table [ SEQ Table \\* ARABIC ]:** Effect of Sample Dilution

| [TSH] uIU/mL      | Sample Dilution 1:5 |      | Sample Dilution 1:10 |      | Sample Dilution 1:25 |      |

| S/B @ 0.16 uIU/mL | 5                   |      | 3                    |      | 2                    |      |

**Figure [ SEQ Figure \\* ARABIC ]:** Effect of Sample Dilution

## 1.15 Effect of Reagent Incubation Time

The effect of shorter reagent incubation times was tested with 10-10-10 minute, 5-5-5 minute and 2-2-1 minute sample, detection conjugate, and substrate incubations respectively. Assay conditions were DAb 100 ng/mL in StabilZyme, 5 ug/mL CAb, and 1:5 sample dilution. Shortening the incubation times to 5 minutes significantly decreased the signal to background ratio (S/B) and at 2-2-1 minute incubations the modulation at the low end of the assay was lost. A 10-10-10 assay format is optimal.

**Table [ SEQ Table \\* ARABIC ]:** Effect of Reagent Incubation Time

| [TSH]<br>uIU/mL | 10, 10, 10 |      | 5, 5, 5 |      | 2, 2, 1 |      |

**Figure [ SEQ Figure \\* ARABIC ]:** Effect of Reagent Incubation Time

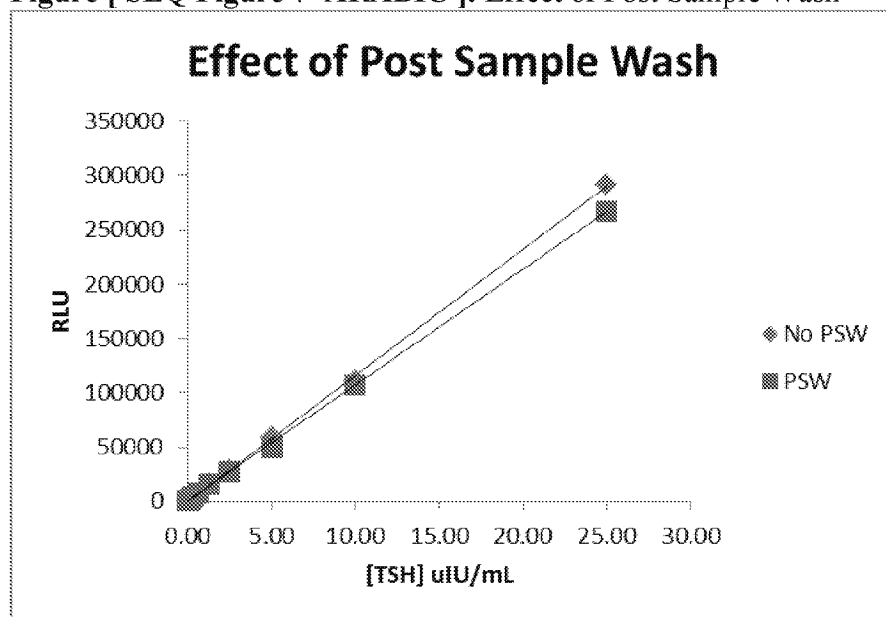

## 1.16 Effect of Post Sample Wash

The effect of a post sample wash was tested with DAb at 100 ng/mL in StabilZyme, CA b 5 ug/mL and a sample dilution of 1:5 with serum calibrators. Adding a post sample washing step slightly reduced modulation across the range, and in particular at the low end. No post sample wash is the optimal condition for this assay.

**Table [ SEQ Table \\* ARABIC ]:** Effect of Post Sample Wash

## 1.17 Determination of Expected LLOQ and ULOQ

A lot of reagents was produced and a serum calibration was performed on the final assay conditions of 100 ng/mL DAb in StabilZyme, 5 ug/mL CAb, and a 1:5 sample dilution with 3 cartridges per point. The LLOQ was 0.05 uIU/mL and the ULOQ was 50 uIU/mL.

**Table [ SEQ Table \\* ARABIC ]:** Serum Standard Curve for Determination of LLOQ and ULOQ

| [TSH] uIU/mL | Signal (RLU) |      | Back-Calculated Conc. (uIU/mL) |      |            |

**Figure [ SEQ Figure \\* ARABIC ]:** Serum Standard Curve for Determination of LLOQ and ULOQ

## 1.18 Hematocrit Effect

The hematocrit effect was determined with 3 samples of whole blood spiked at three levels and at 0. The serum calibration shown in section 1.16 was applied. The spiked whole blood samples were measured, then the remaining spiked whole blood was centrifuged and the resulting plasma was measured on the Theranos System. The spiked TSH and endogenous TSH was found to fully concentrate into the plasma prepared from spiked whole blood. The recovery of TSH in plasma was uniform across the range and for 3 different whole blood samples.

### 1.19 Interfering Matrixes

Hemolyzed, icteric, and lipemic serum samples were obtained from ProMedDx. The recovery of TSH spiked into these potentially interfering matrixes was evaluated on the Theranos System. The serum calibration shown in section 1.16 was applied. The assay did not show any interference from hemolysed, icteric, or lipemic samples, spike recovery was within 15% of nominal.

**Table [ SEQ Table \\* ARABIC ]:** Interfering Matrixes

| Sample Type | [TSH] uIU/mL |         | Signal (RLU) |      | Conc (uIU/mL) |      | % Recovery |
